

CodePrep admits model output only through validation and one atomic commit

One browser contract selects demo fixtures or a signed FastAPI path; validated JSON enters the database only with the quota update.

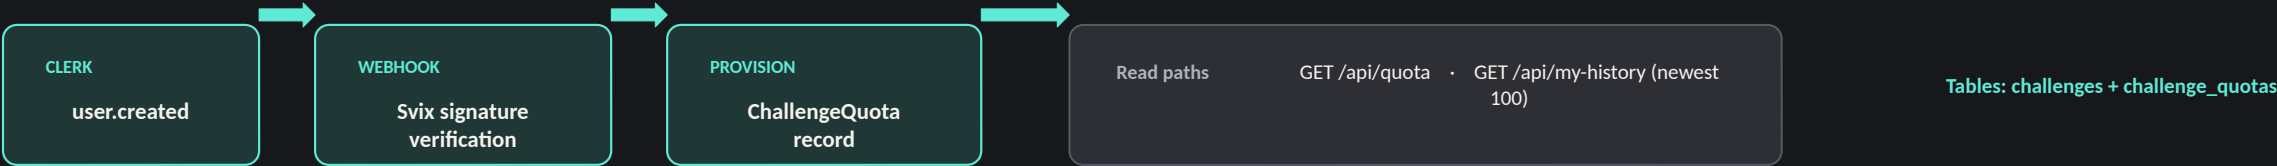

BROWSER RUNTIME

AUTHENTICATED GENERATION PATH

IDENTITY PROVISIONING

TRUST + FAILURE BOUNDARY

SECRETS	Clerk, webhook, and HF secrets remain in backend environment variables	MODEL OUTPUT	malformed, empty, or non-unique options become a generic 503	ATOMICITY	challenge insert and quota decrement share one SQLAlchemy session	SCALE	SQLite is local default; managed Postgres + migrations are still required for scale
